

Elementary Particle Physics

- Everything (matter, waves,...) is ultimately composed of smallest units - particles!
- Have already encountered some particles: Protons, neutrons, electrons, positrons, neutrinos, photons,...
- First 2 are not fundamental - they are made from quarks which are truly point-like (as far as we know)
- Study particles at huge accelerators using big detectors; compare with fundamental theory

Matter Particles

- Make up visible matter
- Pointlike ($<10^{-18}$ m), Fundamental ^{*)}
- Have mass (from $< \frac{1}{2}$ eV to 178,000,000,000 eV = 178 GeV)
- Distinct from their antiparticles ^{*)}
- Fermions (Spin $\frac{1}{2}$) $\Rightarrow$ they “defend” their space (Pauli Principle) and can only be created in particle-antiparticle pairs
- Can be “virtual”, but make up matter being (nearly) “real”
- “stable” (against strong decays; lifetimes from ∞ to 10^{-24} s)

Leptons

3 “colors” = 3 different charges: red, green, blue

Quarks

x2 for R, x2 for antiparticles

^{*)} Until further notice

Forces and Force Carriers

- Mediate Interactions (Forces) - form “Waves”
- Pointlike, Fundamental
- Massless ^{*)}
- Some are their own antiparticles (photon, Z^0 , graviton)
- Spin 1, 2 -> Bosons (tend to cluster together, can be produced in arbitrary numbers)
- Can be real, but carry forces as virtual particles
- Some are absolutely stable (γ , gluons, gravitons)

^{*)} See next slide

BOSONS			force carriers spin = 0, 1, 2, ...		
Unified Electroweak spin = 1			Strong (color) spin = 1		
Name	Mass GeV/c ²	Electric charge	Name	Mass GeV/c ²	Electric charge
γ photon	0	0	g gluon	0	0
W^-	80.4	-1	Gravitation spin = 2		
W^+	80.4	+1	Name	Mass GeV/c ²	Electric charge
Z^0	91.187	0	g graviton	0	0

Note: gluons come in 8 possible combinations of color/anticolor (9th is “sterile” – doesn’t exist)

Higgs Field

- Create “Drag” on Particles (“Molasses”)
- Origin of Mass
Makes some gauge bosons very heavy (W’s, Z’s)
and therefore short-range (“Weak” interaction)
- Origin of electroweak symmetry breaking
- Pointlike, Fundamental
- Bosons (Spin 0)
- Three massless (“swallowed up” by W’s, Z’s); one
very massive (>100 GeV)
- Discovered at the Large Hadron Collider (LHC) at
CERN on July 4, 2012

REYES 2021 - DAY7 - Exploring the world of quarks and gluons with nuclear femtography

QCD MADE SIMPLE

Frank Wilczek 22 AUGUST 2000 PHYSICS TODAY

$$\mathcal{L} = \frac{1}{4g^2} G_{\mu\nu}^a G_{\mu\nu}^a + \sum_j \bar{q}_j (i\gamma^\mu D_\mu + m_j) q_j$$

$$\text{where } G_{\mu\nu}^a \equiv \partial_\mu A_\nu^a - \partial_\nu A_\mu^a + if_{bc}^a A_\mu^b A_\nu^c$$

$$\text{and } D_\mu \equiv \partial_\mu + it^a A_\mu^a$$

That's it!

FIGURE 1. THE QCD LAGRANGIAN $\mathcal{L}$ displayed here is, in principle, a complete description of the strong interaction. But, in practice, it leads to equations that are notoriously hard to solve. Here m_j and q_j are the mass and quantum field of the quark of j th flavor, and A is the gluon field, with spacetime indices μ and ν and color indices a, b, c . The numerical coefficients f and t guarantee SU(3) color symmetry. Aside from the quark masses, the one coupling constant g is the only free parameter of the theory.

How many quarks? From PDG

Figure 51.2: World data on the total cross section of $e^+e^- \rightarrow \text{hadrons}$ and the ratio $R(s) = \sigma(e^+e^- \rightarrow \text{hadrons}, s)/\sigma(e^+e^- \rightarrow \mu^+\mu^-, s)$. $\sigma(e^+e^- \rightarrow \text{hadrons}, s)$ is the experimental cross section corrected for initial state radiation and electron-positron vertex loops, $\sigma(e^+e^- \rightarrow \mu^+\mu^-, s) = 4\pi\alpha^2(s)/3s$. Data errors are total below 2 GeV and statistical above 2 GeV. The curves are an educative guide: the broken one (green) is a naive quark-parton model prediction, and the solid one (red) is 3-loop pQCD prediction (see “Quantum Chromodynamics” section of this *Review*, Eq. (9.7) or, for more details, K. G. Chetyrkin *et al.*, Nucl. Phys. **B586**, 56 (2000) (Erratum *ibid.* **B634**, 413 (2002))). Breit-Wigner parameterizations of J/ψ , $\psi(2S)$, and $\Upsilon(nS)$, $n = 1, 2, 3, 4$ are also shown. The full list of references to the original data and the details of the R ratio extraction from them can be found in [arXiv:hep-ph/0312114]. Corresponding computer-readable data files are available at <http://pdg.lbl.gov/current/xsect/>. (Courtesy of the COMPAS (Protvino) and HEPDATA (Durham) Groups, August 2017. Corrections by P. Janot (CERN) and M. Schmitt (Northwestern U.))

Running of the Strong Coupling Constant

$$\alpha_s(\mu) = \frac{12\pi}{(33 - 2n_f) \ln(\mu^2 / \Lambda^2)}$$

$$\Lambda_{QCD} \approx 0.25 \text{ GeV}$$
